Dear BOLT6 Hiring Team,

I've spent the past three and a half years shipping real-time computer vision systems that can't afford to fail. From oil rigs running 24/7 in harsh conditions to safety-critical deployments for British Petroleum. When I read that your real time products need to deliver continuously, I knew this role was exactly where I want to be next.

At Esbaar, I owned perception pipelines end-to-end on edge devices, taking them from proof-of-concept through production deployment and on-site diagnostics. I built repeatable optimisation workflows using OpenVINO that delivered deterministic performance under tight latency constraints, then personally validated them on oil-rig deployments when things went wrong. At LivNSense, I led a team that re-architected our C++ inference pipeline, tripling throughput from 5 to 15 FPS while reducing false positives by 33% — all while maintaining sub-50ms latency for safety-critical detection.

I am equally comfortable explaining SLAM pose graph optimisation to a product manager and debugging a Kafka message queue at 2am. My MSc thesis involved integrating RTAB-Map with LiDAR odometry and implementing non-linear least squares optimisation in C++ using Ceres. I prefer taking full responsibility over the entire pipeline, as evidenced in my past experience at Esbaar and LivNSense.

I am ready to own computer vision products at BOLT6 from research through deployment, and I would love to discuss how my background in real-time C++ systems and production ML can help your team deliver reliably when the game is on.

Sincerely,

Dexter Fernandes
