Dear Catapult Hiring Team,

I've spent the past three years building production computer vision systems that operate 24/7 in environments where failure isn't an option—from British Petroleum rigs in the desert to industrial safety monitoring for Austin Industries and John Deere. When I read about Catapult's mission to unleash athlete potential through data-driven decisions, I recognised the same commitment to reliability and impact that's driven my work.

At Esbaar, I owned the complete NVIDIA DeepStream 6.x pipeline for live video inference on remote oil rigs, handling everything from model training to production debugging in harsh conditions. I reduced pipeline crashes by 33% through hardened Dockerised microservices and built a watchdog system that autonomously recovered failed services without site visits—critical when the nearest engineer is 500 miles away. This aligns directly with your need for someone who owns the full lifecycle and delivers production-ready artifacts.

Before that, at LivNSense, I led a four-engineer team building multi-stage detection and classification pipelines in TensorFlow, then deployed them as containerised Azure microservices with REST endpoints and autoscaling. I also built low-latency C++17 pipelines with OpenVINO that tripled throughput from 5 to 15 FPS—experience that translates well to your hybrid Python/C++ environment and ONNX Runtime optimisation requirements.

My MSc dissertation at Bristol focused on real-time SLAM with LiDAR and ROS2, where I implemented C++17 point cloud pipelines using PCL and tuned ICP parameters across environments. This geometric computer vision foundation, combined with my production deployment experience, positions me to contribute immediately to your camera calibration and homography pipelines.

I'm excited to bring my end-to-end ownership mindset to a team whose work directly impacts elite athletic performance worldwide.

Sincerely,

Dexter Fernandes
