Charles Carslake & Robert Hyde

Vet Vision AI

Milford, Derbyshire

Dear Mr. Charles and Robert,

I am thrilled to apply for the Computer Vision Engineer/Developer position at VetVision AI, where I can merge my expertise in edge-deployed computer vision solutions with my passion for animal welfare to drive your mission forward. With over three years of experience in optimising AI models for real-world applications, I am eager to contribute to your vision of enhancing livestock health through innovative technology.

During my tenure at LivNSense, I led the development of vision models for industrial edge devices, significantly reducing inference times by 64% (from 250 ms to 90 ms) using advanced techniques like mixed-precision inference. This experience directly aligns with your need for real-time animal monitoring in remote settings. Additionally, my work at Esbaar, where I improved YOLOv5 model performance by 17% for worker detection, demonstrates my ability to enhance action recognition and tracking capabilities. My MSc Robotics project at the University of Bristol further showcases my proficiency in integrating sensor data with actionable insights, as I developed a real-time LiDAR SLAM system on the Clearpath Husky.

Your emphasis on collaboration with veterinary professionals resonates deeply with me. My experience leading cross-functional teams and consulting abroad to deliver tailored solutions highlights my ability to work effectively in multidisciplinary environments. Moreover, my proactive approach to resolving complex technical issues, such as resolving a year-long segmentation fault at Esbaar, mirrors your focus on continuous improvement in fast-paced environments.

I am inspired by VetVision AI's mission to bridge veterinary science and technology. I would welcome the opportunity to discuss how my background in vision model optimisation and edge AI deployment can support your goals.

Sincerely,

Dexter Fernandes
